New isolated human genes and the secreted polypeptide(s) they encode a disorders, immune diseases, inflammation or blood disorders by Disclosure; Page 43; 721pp; English.

This sequence represents a fragment of a secreted human protein encoded This sequence represents a fragment of a secreted human protein encoded to purpose to generate fusion proteins by linking to the gene CC by the nucleic acid molecule designated Gene 64 (V59574).

The gene can be used to generate fusion (e.g. V55502) for increasing the CC at human immunoglobulin Fc portion (e.g. V55502) for increasing the constitution frequences to 186 novel genes and their fragments (nucleic acid sequences: V59511-V59812; amino acid sequences W74731-W75026) which are useful for preventing, treating or ameliorating medical conditions can be diagnosed by determining the amount of the new polypeptides in a sample cor by determining the presence of mutations in the new polypucleotides. Specific uses are described for each of the 186 polynucleotides, based on the content of the lasses of the content of the lasses they are most highly expressed in (see V59511 for described content of the lasses and the lasses they are most highly expressed in (see V59511 for described content of the lasses and the lasses they are most highly expressed in (see V59511 for described content of the lasses they are most highly expressed in (see V59511 for described content of the lasses they are most highly expressed in the lasses they are most highly expressed the lasses they are most highly ea

This sequence represents a secreted human protein encoded by the nucleic acid molecule designated Gene 64 from the human cDNA clone HWWEX24 acid molecule designated Gene 64 from the human cDNA clone HWWEX24 (deposited as clone ATCC 97900 and ATCC 209046).

CC (deposited as clone ATCC 97900 and ATCC 209046).

CC the gene can be used to generate fusion proteins by linking to the gene con a human immunoglobulin Fc portion (e.g. V59502) for increasing the stability of the fused protein as compared to the human protein only.

CC The invention relates to 186 novel genes and their fragments (nucleic acid sequences W74731-W75026) which are useful for preventing, treating or ameliorating medical conditions are useful for preventing, treating or ameliorating medical conditions or by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polypucleotides. Specific uses are described for each of the 186 polynucleotides, based on the control of the secretibed in (see V59511 for described in the control of the c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         encode
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated human genes and the secreted polypeptide(s) they encoders useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders claim 1; Page 578; 721pp; English.

Proposed to the protein a target nucleic acid binding proteins - by designing protein base triplet in a target nucleic acid binding proteins - by designing protein base triplet in a target nucleic acid sequence of a Cys2-His2 zinc finger class based on a nucleic acid base triplet in a target nucleic acid sequence of a Cys2-His2 zinc finger class based on a nucleic acid base triplet in a target nucleic acid sequence of a Cys2-His2 zinc finger. The zinc finger class sequence acid sequence acid sequence snodes an anti-HIV zinc finger. The zinc finger class capable of binding protein (NABP) of the ass made to exemplify the invention. The specification describes a method for preparing a nucleic acid binding protein (NABP) of the cysz-His2 zinc finger class capable of binding to a nucleic acid base of the triplet in a target nucleic acid binding to the 5' base of the triplet is A, then position +6 in the alpha -helix is Ser. Thr. Val. Ala. Glu or Asn. The methods can be used triplet is A, then position +6 in the alpha -helix is Ser. Thr. Val. Ala, Glu or Asn. The methods can be used concerned acid sequence. Thr. Nal. Ala, Glu or Asn. The methods can be used to capable acid sequence. The Nals can be used for the detection of target nucleic acid molecules. They can also be used for the detection of target the delivery of functional genes into defective genes, or the delivery of functional genes into defective genes, or the delivery of functional described nucleic acid to disrupt undesired nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      11-JUL-1998 (first entry)

Homo sapiens 20q13 amplicon ZABC-1 predicted protein.

20q13 amplicon; chromosome 20; tumour; detection; ZABC-1 gene;

chromosomal abnormalities; probe; gene therapy; antisense inhibition;

treatment; age-related macular degeneration; retinitis pigmentation;

Leber's congenital amaurosis; zinc finger amplified in breast cancer.
                                                                                                                                                Anti-HIV zinc finger; nucleic acid binding protein; NABP;

The present sequence represents a nucleic acid binding protein (NBP) of

The present sequence represents a nucleic acid binding to a

nucleic acid quadruplet in a target sequence. The specification

describers a method of preparing the NBP. The method is used for

describers a method of preparing the NBP. The method is used for

conclusion are specifically engineered to recognise particular nucleic

acid sequences and as such are suitable for diagnosis of genetic

acid sequences and as such are suitable for diagnosis of genetic

cald sequences and as such are suitable for diagnosis of chimeric

cald sequences and as undless, and in the manufacture of chimeric

caltsorders. The proteins can be used in the manufacture of chimeric

castriction enzymes, in which a nucleic acid cleaving domain is fused

to a nucleic acid binding domain comprising a zinc finger. Fusion protein

comprising NBP and an integrase, e.g. viral integrase, can be used to

carget nucleic acid sequences in vivo. In gene therapy applications, the

method may be targeted to the delivery of functional genes into defective

genes, or the delivery of nonsense nucleic acid in order to disrupt

undesired nucleic acid. Genes may also be delivered to known, repetitive

stretches of nucleic acid, e.g. centromeres, together with an activating

sequence such as an LCR. NBP can be specifically used to knockout cells

the action of transcription factors, e.g. the activity of HIV tat may be

reduced by NBP specific factors, e.g. the activity of HIV tat may be

calls which comparise a mutation in their endogenous nucleic acid.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DNA was extd. from tumor tissue of 2 cases of IGM-producing diffuse-
type B-cell NHL carrying the t(3:14)(q27;q32) translocation. DNA
analysis showed that the brasphoints on 3q27 were located within 3
kb of the same genomic locus, which was designated bol.6. The
human bcl-6 locus was identified by screening a phage cDNA library
constructed from Bjab B-cell lymphoma mRNA. The zinc finger
protein encoded by bcl-6 is given in R68743. Bcl-6 is a

New sequences from the 20q13 amplicon - used for detecting the sequences from the 20q13 amplicon - used for detecting chromosomal abnormalities, particularly tumours, and for developing products for treating diseases

PT sequence is that of the predicted protein encoded by ZABC-1

Cainc finger amplified in breat cancer). It's coding sequence maps

Cainc finger amplified in breat cancer). It's coding sequence maps

Cainc finger amplified in breat cancer). It's coding sequence maps

Cainc finger amplified in breat cancer.

Cancer can be used as a probe for the detection of chromosomal abnormalities at 20q13. It and other sequences isolated from the 20q13 amplicon are consistently amplified in primary tumours. These sequences copy number of corresponding sequences from a biological sample such as tumour cells. The sequences can also be used in therapeutic applications for modulating the expression of the endogenous gene or the activity antibodies that specifically bind the gene products. The products can also be used in the treatment of other diseases, e.g. age-related antibodies that specifically bind the gene products. The products can consistent and antibodies that specifically bind the gene products. The products can consistent and antibodies that specifically bind the gene products and retinitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 1: Page 8-10: 17pp; English.

The sequence represents human transcription factor-IIIA (hTFIIIA),
a DNA binding protein which is necessary for the initiation of 5s

RNA gene transcription, binding to an internal control region of
the 5s gene. The protein contains 9 zinc finger domains, which are
homologous to the C2H2 finger domains of Xenopus TFIIIA, except for
the 6th finger domain, which has only 3 amino acid residues between
c 2 cysteine residues, instead of 5 amino acid residues for Xenopus
TFIIA, The protein (optionally in recombinant form) and encoding
gene may be used in diagnosis, identification or therapy of
hereditary diseases such as cancer, or other diseases resulting from
abnormal transcriptional control, and to analyse the mechanisms
involved in their activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   'n

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polynocleotide encoding hyper:methylated in cancer (HIC)-7
polypeptide - is tumour suppressor gene, useful for diagnosis,
proponosis and treatment of cancer.

Claim 1; Page 45-50; 71pp; English.

HIC-1 polypeptide (R95242) is encoded by the HIC-1 gene (T29605), or
hypermethylated in cancer, a novel tumour suppressor gene which is
ubiquitously expressed in normal tissues, but underexpressed in tumour
cells (e.g. breast, lung, colon, fibroblasts) where it is
hypermethylated. The HIC-1 polypeptide is characterised as having
a distinct maino acid homology to a highly conserved N-terminal
adistinct maino acid homology to a highly conserved N-terminal
confi, termed the Zin (zinc finger N-terminal) domain present in
zinc finger transcription factors. It also has 5 Kruppel type
cys2-His2 zinc fingers. Detection of HIC-1 is used for the
sequence 547 AA;
                                                                                                                                                                                                                   transcription modulating substances.
Claim 1; Page 10-12; 13pp; German.
This sequence represents a novel My-binding zinc-finger protein which can be used in a method to identify transcription-modulating substances.
This process involves incubating the protein with myc gene product under conditions such that a complex is formed between the two proteins then repeating this step in the presence of one or more test substances and determining the difference in protein complex formation between the first and second step. Substances for which the protein complex formation in the second step is different from that of the first are selected. The protein can be used to produce antibodies. The nucleic acid sequence can Sequence 803 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypoptide binding compounds, useful as potential H. pylori lic cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be production, e.g. in E. coli hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ë,

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 45.702; Variance 77.977; scale 0.586

Statistics:

                                                                                                                                                                                                                                                                                                                                                                                                                               -i- FUNCTION: TRANSCRIPTIONAL REPRESSOR THAT BINDS SPECIFICALLY TO FAT BODY-SPECIFIC ENHANCERS, NAMELY THE ADULT ADH ENHANCER (AAE) AND THE ENHANCER THAT CONTROLS YOLK PROTEIN GENE EXPRESSION.
-i- SUBCELLULAR LOCATION: NUCLEAR.
-i- TISSUE SPECIFICITY: FOUND IN ALL TISSUES EXAMINED INCLUDING THE PAT ADDY.
-i- DEVELOPMENTAL STAGE: HIGHER LEVELS ARE FOUND IN THIRD-INSTAR LARVAE AND IN ADULTS.
                                                                                                                                                                                                                                                                                                               MEDLINE; 92375078.

CONTAINING 2102 (1991).

-: FUNCTION: BROAD-COMPLEX PROTEINS ARE REQUIRED FOR PUFFING AND FRANSCRIPTING NO SALIVARY GLAND LATE GENES DURING METAMORPHOSIS.

-: SUBCELLULAR LOCATION: MUCLEAR.

-: ALTERNATIVE PRODUCTS: AT LEAST FOUR PRODUCTS ARE PRODUCED BY ALTERNATIVE SPLICTING, BCORE.

Cloning and developmental expression of Sna, a murine homologue of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         JIANG R., COPELAND N.G., GILBERT D.J., JENKINS N.A., GRIDLEY T.;
SUBMITTED (MAY-1997) TO EMBL/GENBANK/DDBJ DATA BARKS.
-!- FUNCTION: THIS PROTEIN HAS MANY ROLES DURING POSTIMPLANTATION
DEVELOPMENT. IT IS INVOLVED IN EMBRYONIC MESODERA FORMATION
AND ITS MAINTENANCE AND MAY ALSO BE INVOLVED IN CHONDROGENESIS
AND IN EPITHELIAL-MESENCHYMAL INDUCTIVE INTERACTIONS.
-!- SUBCELLULAR LOCATION: NUCLEAR (POTENTIAL).
-!- DEVELOPMENTAL STRAGE: POSTIMPLANTATION.
-!- SIMILARITY: TO D.MELANOGASTER SNAIL PROTEIN.
                                                                                                         TISSUE-EMBRYO;

Mean 44.353; Variance 77.490; scale 0.572 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
